LOCALITY- 'JAYWANT' BOTANICAL GARDEN KRISHNA MAHAVIDYALAYA, RETHARE BK.

Botanical gardens are often run by universities or other scientific research organizations and have associated with herbaria and research programmes in plant taxonomy or some other aspect of botanical science. In principle their role is to maintain documented collections of living plants for the purposes of scientific research, conservation, display and education, although this will depend on the resources available and the special interests pursued at each particular garden. It may contain special plant collections such as threatened plants, palms, cacti and succulent plants, herb gardens, plants from particular parts of the world, and so on. There may be greenhouses, shade houses, again with special collections such as tropical plants, alpine plants or other exotic plants.

We have visited Krishna Mahavidyalaya Botanical Garden to observe and study the plant wealth conserved in the garden. Different plants observed during the visit are listed below.

LOCALITY- 'JAYWANT' BOTANICAL GARDEN KRISHNA MAHAVIDYALAYA, RETHARE BK.

Botanical gardens are often run by universities or other scientific research organizations and have associated with herbaria and research programmes in plant taxonomy or some other aspect of botanical science. In principle their role is to maintain documented collections of living plants for the purposes of scientific research, conservation, display and education, although this will depend on the resources available and the special interests pursued at each particular garden. It may contain special plant collections such as threatened plants, palms, cacti and succulent plants, herb gardens, plants from particular parts of the world, and so on. There may be greenhouses, shade houses, again with special collections such as tropical plants, alpine plants or other exotic plants.

We have visited Krishna Mahavidyalaya Botanical Garden to observe and study the plant wealth conserved in the garden. Different plants observed during the visit are listed below.

INTRODUCTION

Malvan is a compact town situated on the coast of Western India. The area's beaches, sindhudurg Fort, Tarkali beach, Mobar point, chivla beach, Tondavali beach, are all attract tourists. Malvan town is bound by three small creeks: kasli, kolamb and kalavali. Malvan is the sindhudurg district of Maharashtra is one of the most popular tourist destinations in the state with culturally authentic cuisine and the infamous sindhudurg Fort. The best things to do in malvan include scuba diving in the relatively clear water that the place is famous for.

Kunkeshwar temple was built in the 11th century. Srikant Gurav, priest at the temple said, "This temple was built in 11th century by the Yadava dynasty. Later the temples were renovated by the chhatrapati shivaji Maharaj in the 16th century. Malvan lies on the coastal stretch of Maharastra which is also known as the konkan coast.

The konkan region is spread across the coastal regions of maharastra, Goa and karnataka, bordered with the western ghats and the Arabian sea on its either side.

• SCOPE FOR POULTRT FARING AND IT'S ECONOMIC IMPORTANCE

Poultry is one of the Fastest growing segment of the agricultural sector in India today. India has agricultur emerged on the world map as the 3rd largest egg produce [56 billion eggs] & annul growth rate in egg production approximated 6% per year. The current strength of layer in India is estimated to be ₹230 million & the annual per capita availabity of eggs has increased From 7 egg in 1961 to 52 eggs in 2010 However, the present availability is far below the ICMR recommendation of 180 eggs Per capita For below the. anum In the poultry industry. Value added products utilizing poultry eggs called birds For human consumption have been developed. However only 6% of the eggs producted in the contry are converted into processed egg products mainly For export.

ONE-DAY STUDY TOUR (FIELD VISIT REPORT)

Place: Yashwantrao Mohite Krishna Sahakari Sakhar Karkhana, Rethare Bk

Date: 30th March 2022

B.Sc. Part- III

A one-day study tour (field visit) for B.Sc.III physics student was arranged on 30th February 2022 to visit Yashwantrao Mohite Krishna Sahakari Sakhar Karkhana, Rethare Bk. Mr. Vinayak S. Jadhav along with other teachers accompanied the B.Sc. III students.

The main purpose of the said visit at the sugarcane factory was to observe the co-generation power plant/electricity from sugarcane bagasse and to achieve practical knowledge of how electricity can be generated from sugarcane bagasse.

As the sugarcane factory is nearby our college campus, we started our journey early in the morning at 8.00 am and reached there at 8.20

Engineers gave detailed information about the co-generation power plant which has a capacity of 16 MW. We had made thorough discussion on the production of power/electricity from sugarcane bagasse through steam. The pressure of steam required to rotate the turbine. The principle and working of the turbine have been explained in detail.

The power plant at Yashwantrao Mohite Krishna Sahakari Sakhar karkhana is one of the largest bagasse co-generation plants in Maharashtra which has a capacity of 16 MW. It uses bagasse during the sugarcane crop period to generate steam and electricity for the cluster and electricity for the national grid.

INTRODUCTION

Malvan is a compact town situated on the coast of Western India. The area's beaches, sindhudurg Fort, Tarkali beach, Mobar point, chivla beach, Tondavali beach, are all attract tourists. Malvan town is bound by three small creeks: kasli, kolamb and kalavali. Malvan is the sindhudurg district of Maharashtra is one of the most popular tourist destinations in the state with culturally authentic cuisine and the infamous sindhudurg Fort. The best things to do in malvan include scuba diving in the relatively clear water that the place is famous for.

Kunkeshwar temple was built in the 11th century. Srikant Gurav, priest at the temple said, "This temple was built in 11th century by the Yadava dynasty. Later the temples were renovated by the chhatrapati shivaji Maharaj in the 16th century. Malvan lies on the coastal stretch of Maharastra which is also known as the konkan coast.

The konkan region is spread across the coastal regions of maharastra, Goa and karnataka, bordered with the western ghats and the Arabian sea on its either side.

SCOPE FOR POULTRY FARMING AND ITS ECONOMIC IMPORTANCE

Poultry is one of the fastest growing segments of the agricultured sector in India today. India has emerged on the world map as the third largest egg producer (56 billion eggs) and annual growth rate in egg production approximated 6% per year. The current strength of layers in India is estimated to be 230 million of the annual per capital availability of eggs has increased from 7 eggs in 1961 to 57eggs in 2010. However the present availability is far below the ICMR recommendation of 180 eggs per capita per annum. In the poultry industry, value added products utilizing poultry eggs, called birds for human consumption have been developed. However only 6% of the eggs produced in the country are converted into processed egg products mainly for export.

ASST. PROF. MR. D. L. BANSODE EXPLAINING STUDENTS ABOUT THE ECONOMIC IMPORTANCE OF POULTRY FARMING

The poultry sector in India has undergone a paradigm shift in structure and operation. This transformation has involved sizable investments in breeding, hatching rearing and processing. Farmers in India have moved from rearing non-descript birds to rearing hybrids which ensures faster growth, good livability, excellent feed conversion, high egg production and profits to farmers.

Date

High quality chicks, equipment, vaccines and medicines are now available through both public and public and private layers. Technically and professionally competent guidance is available to the farmers. The managerial practices have improved and disease and mortality incidences are reduced to a great extent. The industry has grown largely due to the initiative of private enterprises, government intervention, and considerable indigenous poultry genetic capabilities and adequate support from the complementary veterinary health, poultry feed, poultry equipment and poultry processing sectors.

NOTICE

Date- 26-01-2022

All the students of B.Sc. III Zoology are hereby informed that prepare a Home Assignment on following questions of each Zoology paper as term work examination and submit it up to 16-02-2022.

Zoology Paper	Questions	Marks
Zoology Paper XIII	1.What Is fertilization ? explain the process of fertilization 2.Explain the process of gastroulation in chick embryology	05 05
Zoology Paper XIV	1.Describe the cells and the organ of immune system 2.Describe the basic properties of antigens	05 05
Zoology Paper XV	1.Describe the economic importance of apiculture. 2.What is the goat farming? Explain the housing in goat farming.	05 05
Zoology Paper XVI	1.Explain the histological structures of stomach and liver 2.Describe the flea born diseases	05 05

Questions for home assignments

B.Sc. III (CBCS) Semester – V

Chemistry paper No. XI (Physical Chemistry)

Q. Attempt **any two** of the following. **(10)**

1) Discuss in detail phenol – water system.
2) What is liquid – liquid junction potential ? How is it eliminated ? How is it determined ?
3) Describe the various factors affecting quantum yield ? Calculate the energy in joules that is associated with i) One quantum and ii) one einstein for the wavelength of radiation 9000 A^0
($N=6.023 \times 10^{23}$, $h=6.62 \times 10^{-34}$ joules. Sec, $C=3 \times 10^8$ m/sec)

B.Sc. III (CBCS) Semester – V

Chemistry paper No. XII (Analytical Chemistry)

Q. Attempt **any two** of the following. **(10)**

1) Explain with schematic diagram, the construction and working of single cell photoelectric colorimeter.
2) Describe construction and working of quinhydrone electrode. Discuss its use in determination of pH of solution.
3) Explain with schematic diagram, the construction and working of single beam direct reading spectrophotometer.

Questions for home assignments

B.Sc. III (CBCS) Semester – V

Chemistry paper No. IX (Inorganic Chemistry)

Q. Attempt **any two** of the following. **(10)**

1) What are semiconductors? Discuss 'n' and 'p' types semiconductors w.r.t. band theory.

2) Discuss types of catalysis with suitable examples.

3) Draw the MO diagram for $[CoF_6]^{3-}$ ion and $[Co(NH_3)_6]^{+}$ ion.

B.Sc. III (CBCS) Semester – V

Chemistry paper No. X (Organic Chemistry)

Q. Attempt **any two** of the following. **(10)**

1) Discuss the effect of conjugation on the band position in UV-Spectra.

2) What is Chemical Shift? Explain factors affecting chemical shift values.

3) Explain advantages and disadvantages of spectroscopic methods?

1. Introduction:

Over the last few decades, to fulfil the growing energy demands and to reduce environmental pollution, energy harvesting using renewable energy sources, their proper conversion, and advanced storage techniques have become a leading area of research and are being extensively studied. Global warming is receiving worldwide attention, and means to improve its harmful consequences are of the greatest urgency. Major changes in energy technology will be necessary, which will impact the global economy. Renewable energy sources such as wind, solar, etc are irregular, and their availability depends on various situations like time, weather, and geographical location [1]. To avail the energy as per user's demand even though the sources are absent, it's become more vital to convert and store energy effectively. Therefore, over the last few decades, to fulfill the growing energy demands and to reduce environmental pollution, energy harvesting using renewable energy sources, their proper conversion, and advanced storage techniques have become a leading area of research and are being extensively studied [2] [3].

Various energy storage devices like fuel cells, batteries, capacitors, and electrochemical capacitors (ECs) or supercapacitors (SCs) are widely used to store energy. Supercapacitors with high specific power (>10 kW/kg) and low internal resistance are superior to a battery as being able to store and deliver energy at relatively high rates. They are widely used in many devices such as mobile phones, digital cameras, and solar cell power storage due to their features like long cycling stability (>10^5 cycles), fast charge-discharge rate, and easy fabrication with low maintenance [4]. All of the above features of supercapacitors enable them to provide high power in areas where current battery technology fails. But low energy density, despite all these features, greatly affects its commercial use. Transition metal oxides (TMOs), their hydroxides, conducting polymers (CPs), carbon, and their derivatives have been used as active materials for energy storage applications.

Depending upon the charge storage mechanism, supercapacitors are classified into three types electrochemical double-layer capacitors (EDLC), pseudocapacitors, and hybrid capacitors/lithium-ion capacitors. In EDLC charge is stored electrostatically, in which accumulation and separation of charge take place at the electrode and electrolyte interface (also known as Helmholtz's double layer). Carbon and its derivatives like graphene, activated carbon etc have been widely used as EDLC electrodes. In pseudocapacitor, the charge is stored with faradaic processes in the electrode, with reversible adsorption, redox reactions (in TMOs), and reversible electrochemical doping-dedoping process (in CPs) in the electrodes as per chosen electrode material. Transition-metal oxides (TMOs) like WO_3, Co_3O_4, NiO, V_2O_5, IrO_2, RuO_2, Fe_3O_4, MnO_2 etc, transition metal sulphides and conducting polymers (CPs) such as Polyaniline (PANI), Polypyrrole (PPy), poly (3,4-ethylenedioxythiophene) (PEDOT), polyacetylene, poly (4-styrene sulfonate) (PSS), poly-phenylene-vinylene (PPV), polythiophene, polyvinyl alcohol (PVA) etc. are widely used in pseudocapacitor.

Among TMOs, the platinum group metal (PGM) oxides like Iridium oxide (IrO_2)), rhodium oxide (RhO_2), and ruthenium oxide (RuO_2), are the best electrode materials for electrochemical capacitor application. Many researchers studied these materials, as they possess high specific energy and specific capacitance, but much costly for their commercial use. Low-cost cobalt oxide (Co_3O_4) is considered a promising material, which has been studied most intensively due to its good rate capability, excellent redox activity, environmental friendliness, high surface area, and high theoretical specific capacitance (SC) of approximately 3560 F/g (theoretical capacity 890 mAh/g). Co_3O_4 is p-type antiferromagnetic oxide semiconductor, with three polymorphs such as monoxide or cobaltous oxide (CoO), cobaltic oxide (Co_2O3), and cobaltosic oxide or cobalt cobaltite (Co_3O_4), having highest Curie temperature (Tc =1396K). Different strategies are being used to enable devices to raise their specific

power without compromising its specific energy, and as well as better rate capability, fast charging-discharging route, and high specific capacitances.

Literature survey reveals that the structure of synthesized electrode material plays a vital role in energy storage performance in order to enhance the specific energy and specific power performance of the material. In this framework, in the past few years, reports showed that morphological studies resulted in various nanostructures of Co_3O_4 such as nanoparticles [5], urchin-like nanostructure[6] , nanofibers [7], needle-like [8], nanoflakes [9], quantum dots (QDs) [10], nanocubes[11] etc have been extensively investigated. However, hydrothermal method has many advantages such as it has ability to create crystalline phases of the material that are not stable at their melting point and the materials that have a high vapor pressure near their melting points can be grown by the hydrothermal method. In the hydrothermal method, the morphology of synthesized material can be controlled easily with the help of suitable pressure and temperature depending on the main ingredients of the precursor solution. The concentration of precursor and reaction time also has a great impact on the morphology.

The flower like porous arrangement of nanowires in Co_3O_4 electrode (diameter 50 nm) synthesized using hydrothermal route, assist the easy charge transport and distribution of electrolyte in bulk of electrode, resulted into SC of 493 F/g[12]. Yang et al. designed uniform ultrathin Co_3O_4 nanosheet arrays via two-step hydrothermal reaction showed a SC of 1782 F/g at current density 5 mA/cm^2. Additionally, it showed long-term stability by retaining capacitance greater than 90 % after 2000 cycles [13]. In 2015, Feng et al. reported large scale ultrathin Co_3O_4 nanofilms without any organic additive by facile one-step hydrothermal route with the support of cobalt-ammonia complexes nitrate. The electrode showed large SC 1400 F/g at current density of 1A/g [14]. Hierarchical hollow Co_3O_4 nanotubes by template-hydrothermal reaction with guanidine hydrochloride as precipitant and activated carbon as hard template have been reported by Yao et al in 2015. The

results show that 1-D hierarchical hollow nanotubes of Co_3O_4 has higher SC (1006 F/g at 1A/g) compared to Co_3O_4 prepared with guanidine hydrochloride without hard template (608 F/g at 1 A/g) [15].

Researchers are using hydrothermal route followed by high temperature heating to synthesize Co_3O_4 nanostructures. However, Feng and co-workers synthesized hollow Co_3O_4 microspheres at the low temperature (120 ^oC) hydrothermal method without subsequent heating. The electrochemical studies provided ultrahigh SC of 1227 F/g at 1A/g current density for synthesized hollow Co_3O_4 microspheres[16]. The addition of ions (such as Na^+, Cl^-, NO_3^-, CO_3^{2-}, K^+ etc) in the precursor and distinct hydrolysis agent has an influence on the morphology of the precursor. The hydrolysis, electronegativity, and ionization of additive ions has an effect on the growth of the precursor. The 3-D hierarchical flower-like Co_3O_4 assembled with an ions-assisted hydrothermal method with NaCl additive and hexamethylenetetramine (HMT) as hydrolysis agent retains 96.07 % after 10000 cycles at 5 A/g current density[17]. Recently, Paliwal and co-workers synthesized sedge like Co_3O_4 nanoarrays with SC of 2510 F/g at 4 A/g current density in 6M KOH [18].

Different strategies are being used to enable devices to raise their specific power without compromising its specific energy, and as well as better rate capability, fast charging-discharging route, and high specific capacitances. To solve the problems mentioned above, herein, we proposed Co_3O_4 based thin film by a very facile and simple double hydrothermal technique for the synthesis as the electrode material for energy storage device application.

2. Synthesis of Nanostructured Co_3O_4 thin film:

The nanostructured Co_3O_4 thin film was synthesized from a precursor solution containing $Co(NO_3)_2.6H_2O$ (1 mmol), NH_4F (4 mmol), $CO(NH_2)_2$ (5 mmol) in 16 ml distilled water (DW). Solution was magnetically stirred for 15 min. Ni foam was

cleaned by mixture of acetone, ethanol and DI water with assistance of ultrasonication for several minutes. Afterwards, cleaned Ni foam put against the wall of a Teflon lined stainless steel autoclave and the resulting solution is transferred into it. The autoclave was maintained at 100^0C for 4 h. For effective mass loading of active material, we have adopted second hydrothermal reaction. Typically, synthesized structure was kept in a solution containing $Co(NO_3)_2.6H_2O$, $CO(NH_2)_2$ and DW in a autoclave for at 120^0C for 2 (or for 6 hours). Then, the film was taken out from autoclave and washed several times with DW and acetone to remove impurities. Finally, the films were annealed at 250^0C for 3 hours. Here films developed films at 2 hours and 6 hours were denoted as $Co_3O_{4@}2$ and $Co_3O_{4@}6$ respectively.

3. Characterization:

The surface morphology and stucuture of the samples were examined by scanning electron microscopy (SEM; Model JEOL-JSM-6360, Japan, operated at 20 kV) with a thin layer of gold sputter coated prior to analyses. All the electrochemical measurements were performed in an electrolyte (2 M KOH) in a conventional three-electrode arrangement comprising platinum wire as the counter electrode and Ag/AgCl serving as the reference electrode using electrochemical quartz crystal measurements (model-CHI-400A) made by CH Instruments, USA. The scan rates of CV were in the range of 10-200 mV s^{-1}. EIS was studied at 100000 Hz to 0.1 Hz at 10 mV applied potential with respect to reference electrode.

4. Results and Discussion:

4.1 Morphological Study:

Fig. 1 (a and b) shows SEM images of nanostructured Co_3O_4 thin film. Fig. 1 (a) revealed non-uniform nanoflowers having sharp spikes microstructures with an average size of 10-12 µm in diameter has resulted of as-developed nanostructures

Co_3O_4@6 film. Fig. 1 (b) shows the morphology as-developed nanostructures Co_3O_4@2 film, revealed non-uniform sharp spikes comprising nanoflowers with thinner sharp spikes with an average size of 5 µm. The morphology have greatly influenced on electrochemical properties. The as-synthesized films display a highly porous structure that facilitates a large surface area surface which is beneficial for good electrochemical performance.

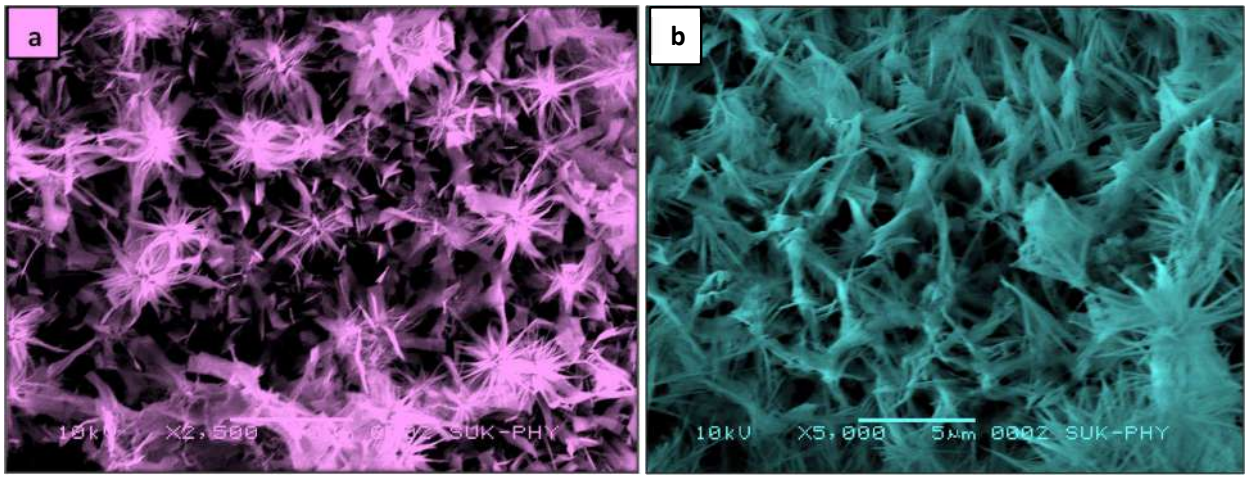

Figure.1 SEM images of as-synthesized (a) Co_3O_4@6 and (b) Co_3O_4 @2.

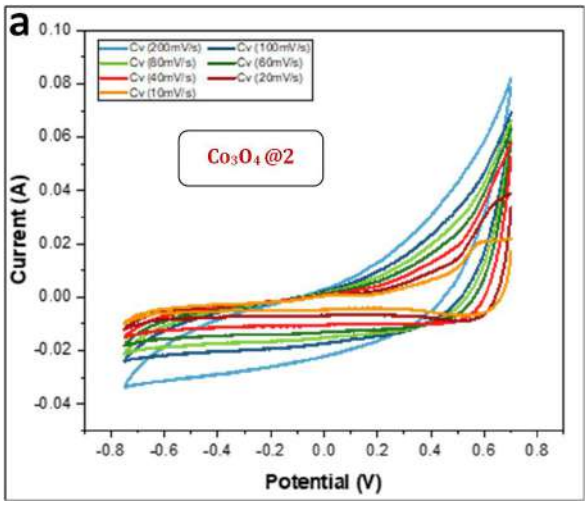

4.2 Cyclic voltammograms (CV) :

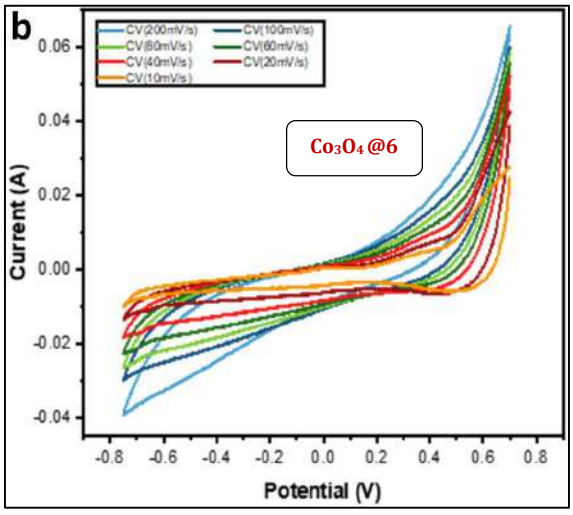

Cyclic voltammogram (CV) curves of Co_3O_4 nanoflower electrode is shown in Figure 2. CV curve of as-synthesized Co_3O_4@2 (figure 2a) and Co_3O_4@6 (figure 2b) at various scan rates 200, 100, 80, 60, 40, 20, 10 mV s^{-1} within a potential range of 0.7 V to -0.75 V (vs Ag/AgCl) in 2 M KOH aqueous electrolyte were performed is shown in figure 2a and 2b. Figure 2c shows the CV of Co_3O_4@6 and Co_3O_4@2 at 10mV s^{-1} scan rate. The CV profiles strongly influence with the morphology and the surface properties. The non-ideally rectangular shape of the CV curves demonstrate that the capacitive behavior is mainly characteristic of Faradic pseudocapacitance process originating from reversible redox reaction rather than electric double layer capacitance. Hence, a typical pseudocapacitance

behavior is observed in the CV curves due to Faradaic redox reaction [7]. The areal capacitance (C_a, F cm^{-2}) values at different scan rates (υ, mV s^{-1}) in the CV measurement are calculated using the following equation

$$C_a = \frac{\int I \, dV}{\upsilon . A . V}$$

V (in volt) is the applied potential window and A (in cm^{-2}) is the area of the active electrode material. As the scan rate increase from the 10 to 200 mV s^{-1} , areal capacitance of both the as-synthesized nanostructures decrease. Both the films displayed highest areal capacitance value at 10 mV s^{-1}. The calculated areal capacitance at 10 mVs^{-1} for Co_3O_4@6 and Co_3O_4@2 are found to be 324 and 362 mF cm^{-2} respectively. The increase in areal capacitance can be explained by the more effective insertion/extraction of ions into the Co_3O_4@2 film based on larger diffusivity at low reaction temperature during second hydrothermal process and the highly porous morphology.

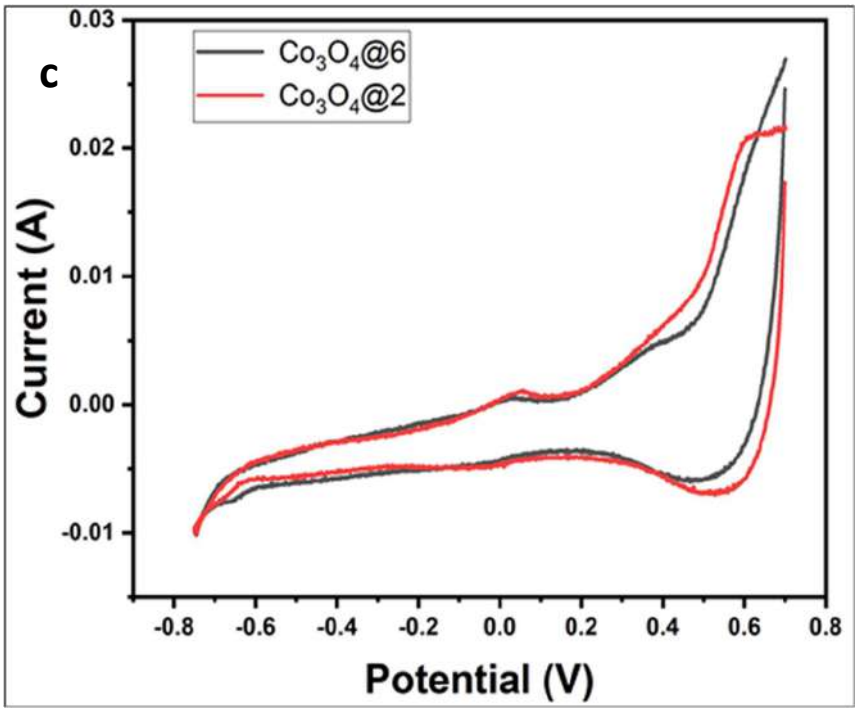

Figure 2 Cyclic voltammograms curve recorded at various scan rates within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) in 2 M KOH aqueous electrolyte of as-synthesized (a) Co_3O_4@2 (b) Co_3O_4@6 (c) CV for both synthesized thin films at 10mV/s scan rate.

4.3 Galvanostatic charge–discharge (GCD) measurement :

The GCD curves of for Co_3O_4@2 (in figure 3a) and Co_3O_4@6 (in figure 3b) were studied within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) at 5, 7.5, 10, & 15 mA cm^{-2} current densities, using a three-electrode cell in 2 M KOH aqueous electrolyte. Variation in capacity as a function of current density displayed the high areal capacitance at low current density . Discharge curve of Co_3O_4@2 and Co_3O_4@6 shows a significant deviation from a straight line, indicating that the capacity mainly comes from the faradaic redox reactions.

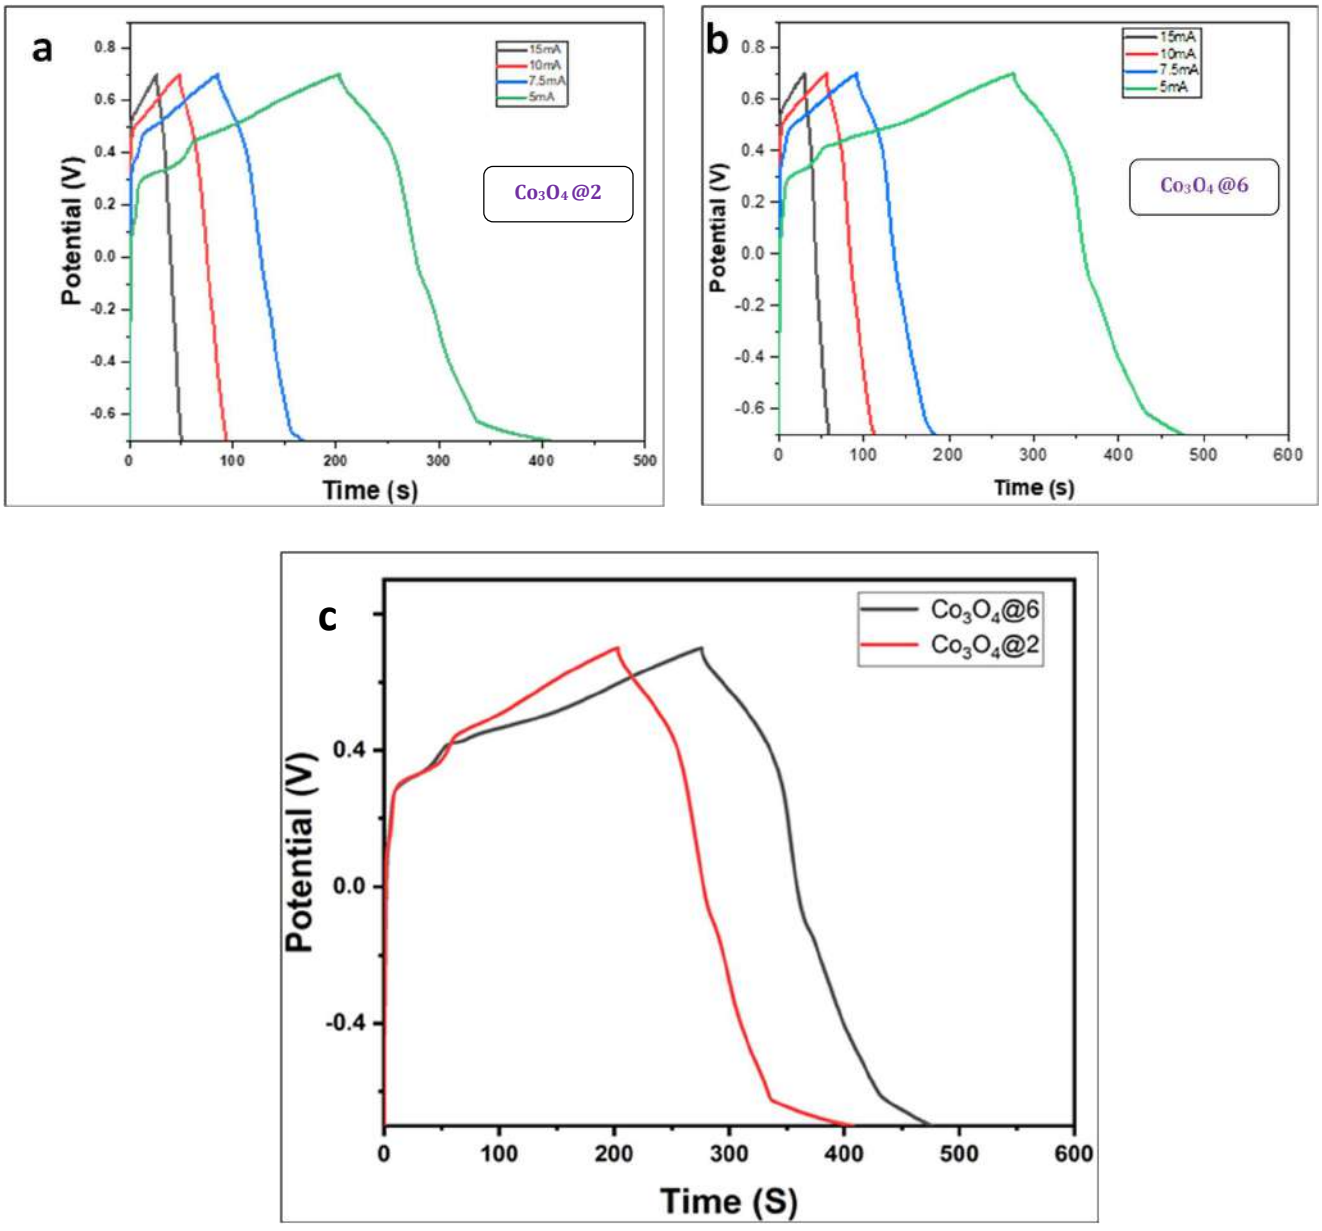

Figure 3. GCD curve recorded at within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) are performed at 5, 7.5, 10, & 15 mA cm^{-2} current densities using a three-electrode cell in 2 M KOH aqueous electrolyte of as-synthesized (a) Co_3O_4@2 (b) Co_3O_4@6 (c) GCD for both synthesized thin films at 5 mA cm^{-2} current density.

4.4 ELECTROCHEMICAL IMPEDANCE MEASUREMENTS (EIS) :

EIS was studied for Co_3O_4 nanoflower electrode in the frequency range of 100000 Hz to 0.1 Hz at 10 mV applied potential with respect to reference electrode is shown in Figure 4. The diameter of the semicircle in EIS spectrum represent the electron transfer resistance (R_{ct}), which controls the electron transfer kinetics of the redox reaction at the electrode interface. Thus, both the Co_3O_4@6 and Co_3O_4@2 exhibited high electrochemical performance with low R_{ct}. The curve of Co_3O_4@2 showed a smaller diameter of the semicircle than that of the Co_3O_4@6. Low internal resistance is achieved by decreasing the time of hydrothermal process, that facilitates the electron transfer kinetics and resulted in improved areal capacity.

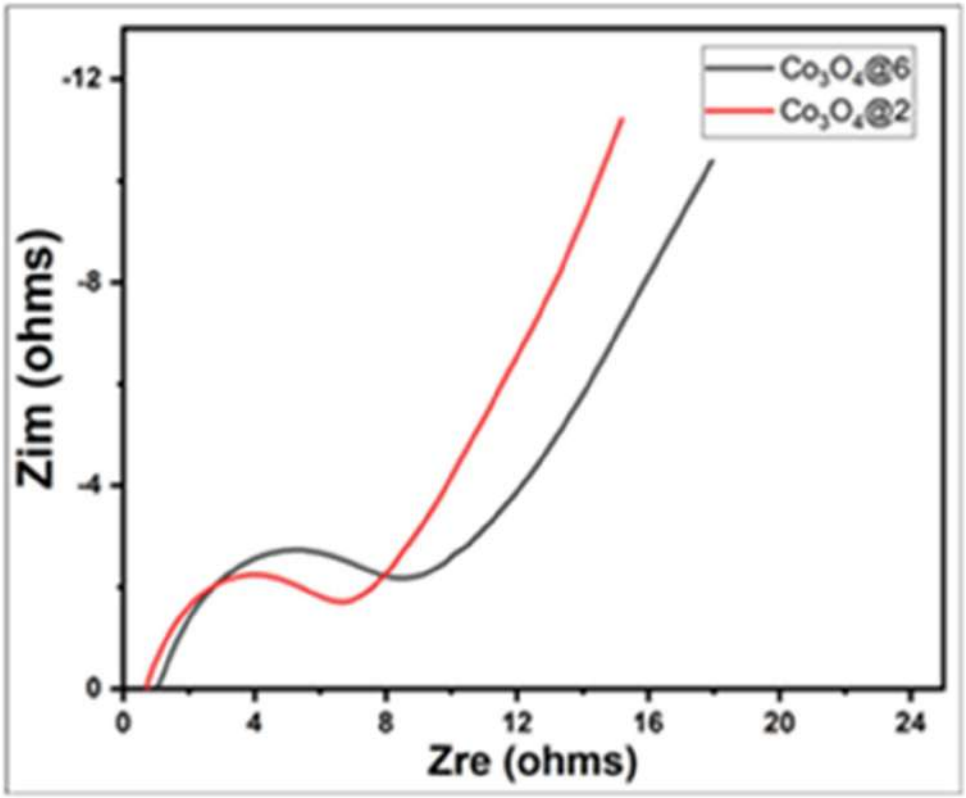

Figure 4. EIS of as synthesized Co_3O_4@2 and Co_3O_4@6 nanostructures.

Conclusions:

Nanostructured Co_3O_4 thin film has been deposited by hydrothermal method for high performance energy storage application. The effect of varying hydrothermal temperature and time on the morphology and capacitance of as-synthesized electrode was investigated. SEM study revealed non-uniform nanoflowers having sharp spikes microstructures was resulted. As the reaction time in second hydrothermal decreses, the density of spikes increases and nanoflowers spikes becomes more sharp. The obtained electrode delivered high operating voltage (about 1.4V), low resistance with a areal capacitance of 362 mF cm^{-2} at a 10 mV s^{-1} scan rate. The effect of reaction time variation in synthesis process on electrochemical performance is studied and decrease of hydrothermal time resulted in low resistance and relatively high areal capacitance of synthesized electrode. The excellent capacitance of the nanostructured Co_3O_4 is due to large surface area provided by nanostructured Co_3O_4 with porous morphology having sharp spikes. It has been evidenced that the morphology resulted in good areal capacitance which confirms that the film deposited by double hydrothermal route are well suited for high performance energy storage application.

1. Introduction:

Over the last few decades, to fulfil the growing energy demands and to reduce environmental pollution, energy harvesting using renewable energy sources, their proper conversion, and advanced storage techniques have become a leading area of research and are being extensively studied. Global warming is receiving worldwide attention, and means to improve its harmful consequences are of the greatest urgency. Major changes in energy technology will be necessary, which will impact the global economy. Renewable energy sources such as wind, solar, etc are irregular, and their availability depends on various situations like time, weather, and geographical location [1]. To avail the energy as per user's demand even though the sources are absent, it's become more vital to convert and store energy effectively. Therefore, over the last few decades, to fulfill the growing energy demands and to reduce environmental pollution, energy harvesting using renewable energy sources, their proper conversion, and advanced storage techniques have become a leading area of research and are being extensively studied [2] [3].

Various energy storage devices like fuel cells, batteries, capacitors, and electrochemical capacitors (ECs) or supercapacitors (SCs) are widely used to store energy. Supercapacitors with high specific power (>10 kW/kg) and low internal resistance are superior to a battery as being able to store and deliver energy at relatively high rates. They are widely used in many devices such as mobile phones, digital cameras, and solar cell power storage due to their features like long cycling stability (>10^5 cycles), fast charge-discharge rate, and easy fabrication with low maintenance [4]. All of the above features of supercapacitors enable them to provide high power in areas where current battery technology fails. But low energy density, despite all these features, greatly affects its commercial use. Transition metal oxides (TMOs), their hydroxides, conducting polymers (CPs), carbon, and their derivatives have been used as active materials for energy storage applications.

Depending upon the charge storage mechanism, supercapacitors are classified into three types electrochemical double-layer capacitors (EDLC), pseudocapacitors, and hybrid capacitors/lithium-ion capacitors. In EDLC charge is stored electrostatically, in which accumulation and separation of charge take place at the electrode and electrolyte interface (also known as Helmholtz's double layer). Carbon and its derivatives like graphene, activated carbon etc have been widely used as EDLC electrodes. In pseudocapacitor, the charge is stored with faradaic processes in the electrode, with reversible adsorption, redox reactions (in TMOs), and reversible electrochemical doping-dedoping process (in CPs) in the electrodes as per chosen electrode material. Transition-metal oxides (TMOs) like WO_3, Co_3O_4, NiO, V_2O_5, IrO_2, RuO_2, Fe_3O_4, MnO_2 etc, transition metal sulphides and conducting polymers (CPs) such as Polyaniline (PANI), Polypyrrole (PPy), poly (3,4-ethylenedioxythiophene) (PEDOT), polyacetylene, poly (4-styrene sulfonate) (PSS), poly-phenylene-vinylene (PPV), polythiophene, polyvinyl alcohol (PVA) etc. are widely used in pseudocapacitor.

Among TMOs, the platinum group metal (PGM) oxides like Iridium oxide (IrO_2)), rhodium oxide (RhO_2), and ruthenium oxide (RuO_2), are the best electrode materials for electrochemical capacitor application. Many researchers studied these materials, as they possess high specific energy and specific capacitance, but much costly for their commercial use. Low-cost cobalt oxide (Co_3O_4) is considered a promising material, which has been studied most intensively due to its good rate capability, excellent redox activity, environmental friendliness, high surface area, and high theoretical specific capacitance (SC) of approximately 3560 F/g (theoretical capacity 890 mAh/g). Co_3O_4 is p-type antiferromagnetic oxide semiconductor, with three polymorphs such as monoxide or cobaltous oxide (CoO), cobaltic oxide (Co_2O3), and cobaltosic oxide or cobalt cobaltite (Co_3O_4), having highest Curie temperature (Tc =1396K). Different strategies are being used to enable devices to raise their specific

power without compromising its specific energy, and as well as better rate capability, fast charging-discharging route, and high specific capacitances.

Literature survey reveals that the structure of synthesized electrode material plays a vital role in energy storage performance in order to enhance the specific energy and specific power performance of the material. In this framework, in the past few years, reports showed that morphological studies resulted in various nanostructures of Co_3O_4 such as nanoparticles [5], urchin-like nanostructure[6] , nanofibers [7], needle-like [8], nanoflakes [9], quantum dots (QDs) [10], nanocubes[11] etc have been extensively investigated. However, hydrothermal method has many advantages such as it has ability to create crystalline phases of the material that are not stable at their melting point and the materials that have a high vapor pressure near their melting points can be grown by the hydrothermal method. In the hydrothermal method, the morphology of synthesized material can be controlled easily with the help of suitable pressure and temperature depending on the main ingredients of the precursor solution. The concentration of precursor and reaction time also has a great impact on the morphology.

The flower like porous arrangement of nanowires in Co_3O_4 electrode (diameter 50 nm) synthesized using hydrothermal route, assist the easy charge transport and distribution of electrolyte in bulk of electrode, resulted into SC of 493 F/g[12]. Yang et al. designed uniform ultrathin Co_3O_4 nanosheet arrays via two-step hydrothermal reaction showed a SC of 1782 F/g at current density 5 mA/cm^2. Additionally, it showed long-term stability by retaining capacitance greater than 90 % after 2000 cycles [13]. In 2015, Feng et al. reported large scale ultrathin Co_3O_4 nanofilms without any organic additive by facile one-step hydrothermal route with the support of cobalt-ammonia complexes nitrate. The electrode showed large SC 1400 F/g at current density of 1A/g [14]. Hierarchical hollow Co_3O_4 nanotubes by template-hydrothermal reaction with guanidine hydrochloride as precipitant and activated carbon as hard template have been reported by Yao et al in 2015. The

results show that 1-D hierarchical hollow nanotubes of Co_3O_4 has higher SC (1006 F/g at 1A/g) compared to Co_3O_4 prepared with guanidine hydrochloride without hard template (608 F/g at 1 A/g) [15].

Researchers are using hydrothermal route followed by high temperature heating to synthesize Co_3O_4 nanostructures. However, Feng and co-workers synthesized hollow Co_3O_4 microspheres at the low temperature (120 ^oC) hydrothermal method without subsequent heating. The electrochemical studies provided ultrahigh SC of 1227 F/g at 1A/g current density for synthesized hollow Co_3O_4 microspheres[16]. The addition of ions (such as Na^+, Cl^-, NO_3^-, CO_3^{2-}, K^+ etc) in the precursor and distinct hydrolysis agent has an influence on the morphology of the precursor. The hydrolysis, electronegativity, and ionization of additive ions has an effect on the growth of the precursor. The 3-D hierarchical flower-like Co_3O_4 assembled with an ions-assisted hydrothermal method with NaCl additive and hexamethylenetetramine (HMT) as hydrolysis agent retains 96.07 % after 10000 cycles at 5 A/g current density[17]. Recently, Paliwal and co-workers synthesized sedge like Co_3O_4 nanoarrays with SC of 2510 F/g at 4 A/g current density in 6M KOH [18].

Different strategies are being used to enable devices to raise their specific power without compromising its specific energy, and as well as better rate capability, fast charging-discharging route, and high specific capacitances. To solve the problems mentioned above, herein, we proposed Co_3O_4 based thin film by a very facile and simple double hydrothermal technique for the synthesis as the electrode material for energy storage device application.

2. Synthesis of Nanostructured Co_3O_4 thin film:

The nanostructured Co_3O_4 thin film was synthesized from a precursor solution containing $Co(NO_3)_2.6H_2O$ (1 mmol), NH_4F (4 mmol), $CO(NH_2)_2$ (5 mmol) in 16 ml distilled water (DW). Solution was magnetically stirred for 15 min. Ni foam was

cleaned by mixture of acetone, ethanol and DI water with assistance of ultrasonication for several minutes. Afterwards, cleaned Ni foam put against the wall of a Teflon lined stainless steel autoclave and the resulting solution is transferred into it. The autoclave was maintained at 100^0C for 4 h. For effective mass loading of active material, we have adopted second hydrothermal reaction. Typically, synthesized structure was kept in a solution containing $Co(NO_3)_2.6H_2O$, $CO(NH_2)_2$ and DW in a autoclave for at 120^0C for 2 (or for 6 hours). Then, the film was taken out from autoclave and washed several times with DW and acetone to remove impurities. Finally, the films were annealed at 250^0C for 3 hours. Here films developed films at 2 hours and 6 hours were denoted as $Co_3O_{4@}2$ and $Co_3O_{4@}6$ respectively.

3. Characterization:

The surface morphology and stucuture of the samples were examined by scanning electron microscopy (SEM; Model JEOL-JSM-6360, Japan, operated at 20 kV) with a thin layer of gold sputter coated prior to analyses. All the electrochemical measurements were performed in an electrolyte (2 M KOH) in a conventional three-electrode arrangement comprising platinum wire as the counter electrode and Ag/AgCl serving as the reference electrode using electrochemical quartz crystal measurements (model-CHI-400A) made by CH Instruments, USA. The scan rates of CV were in the range of 10-200 mV s^{-1}. EIS was studied at 100000 Hz to 0.1 Hz at 10 mV applied potential with respect to reference electrode.

4. Results and Discussion:

4.1 Morphological Study:

Fig. 1 (a and b) shows SEM images of nanostructured Co_3O_4 thin film. Fig. 1 (a) revealed non-uniform nanoflowers having sharp spikes microstructures with an average size of 10-12 µm in diameter has resulted of as-developed nanostructures

Co_3O_4@6 film. Fig. 1 (b) shows the morphology as-developed nanostructures Co_3O_4@2 film, revealed non-uniform sharp spikes comprising nanoflowers with thinner sharp spikes with an average size of 5 µm. The morphology have greatly influenced on electrochemical properties. The as-synthesized films display a highly porous structure that facilitates a large surface area surface which is beneficial for good electrochemical performance.

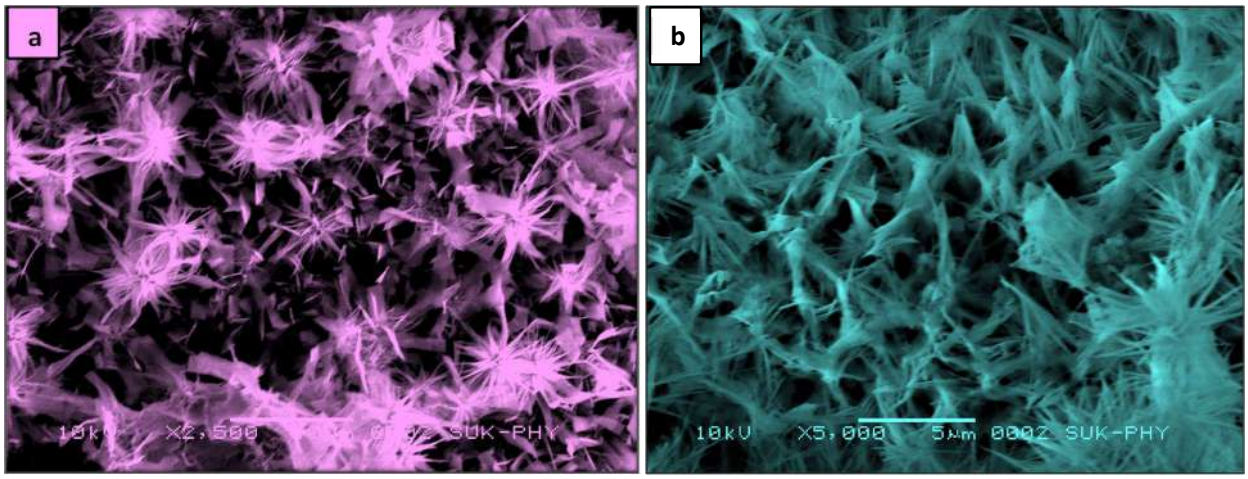

Figure.1 SEM images of as-synthesized (a) Co_3O_4@6 and (b) Co_3O_4 @2.

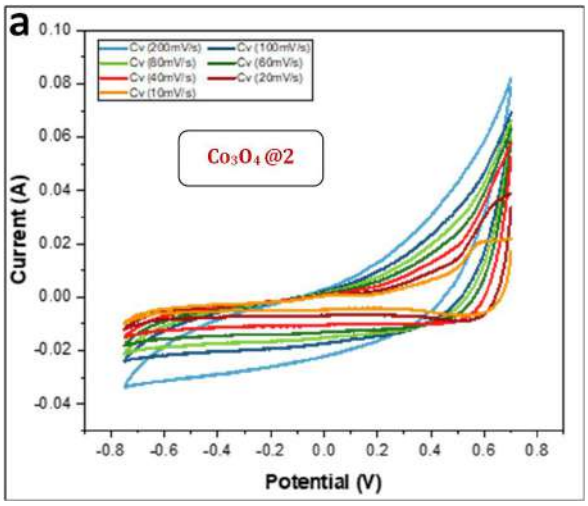

4.2 Cyclic voltammograms (CV) :

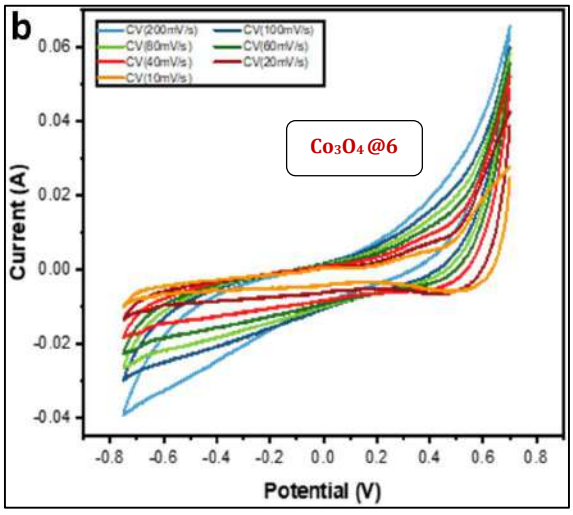

Cyclic voltammogram (CV) curves of Co_3O_4 nanoflower electrode is shown in Figure 2. CV curve of as-synthesized Co_3O_4@2 (figure 2a) and Co_3O_4@6 (figure 2b) at various scan rates 200, 100, 80, 60, 40, 20, 10 mV s^{-1} within a potential range of 0.7 V to -0.75 V (vs Ag/AgCl) in 2 M KOH aqueous electrolyte were performed is shown in figure 2a and 2b. Figure 2c shows the CV of Co_3O_4@6 and Co_3O_4@2 at 10mV s^{-1} scan rate. The CV profiles strongly influence with the morphology and the surface properties. The non-ideally rectangular shape of the CV curves demonstrate that the capacitive behavior is mainly characteristic of Faradic pseudocapacitance process originating from reversible redox reaction rather than electric double layer capacitance. Hence, a typical pseudocapacitance

behavior is observed in the CV curves due to Faradaic redox reaction [7]. The areal capacitance (C_a, F cm^{-2}) values at different scan rates (υ, mV s^{-1}) in the CV measurement are calculated using the following equation

$$C_a = \frac{\int I \, dV}{\upsilon . A . V}$$

V (in volt) is the applied potential window and A (in cm^{-2}) is the area of the active electrode material. As the scan rate increase from the 10 to 200 mV s^{-1} , areal capacitance of both the as-synthesized nanostructures decrease. Both the films displayed highest areal capacitance value at 10 mV s^{-1}. The calculated areal capacitance at 10 mVs^{-1} for Co_3O_4@6 and Co_3O_4@2 are found to be 324 and 362 mF cm^{-2} respectively. The increase in areal capacitance can be explained by the more effective insertion/extraction of ions into the Co_3O_4@2 film based on larger diffusivity at low reaction temperature during second hydrothermal process and the highly porous morphology.

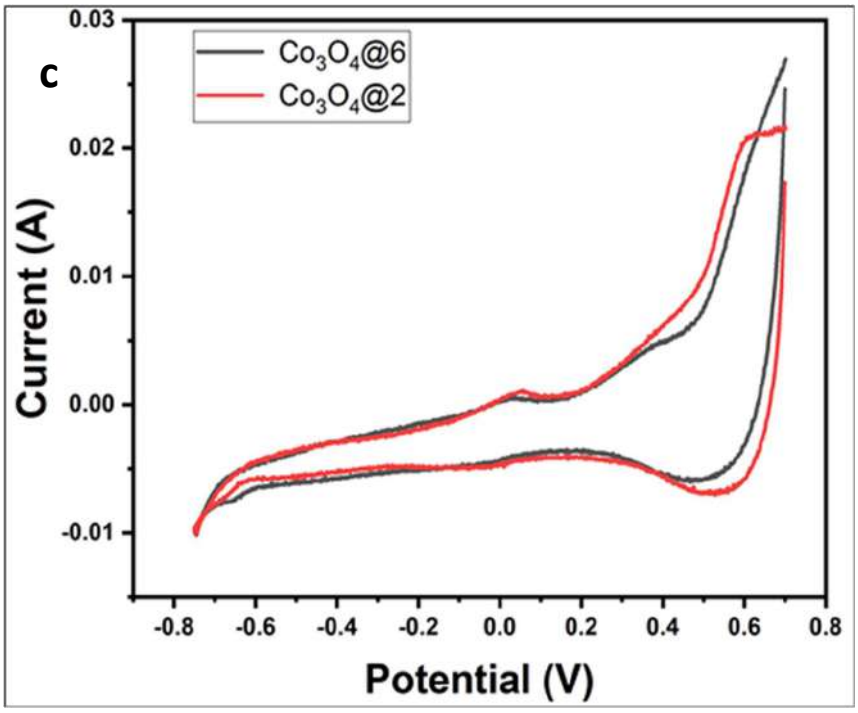

Figure 2 Cyclic voltammograms curve recorded at various scan rates within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) in 2 M KOH aqueous electrolyte of as-synthesized (a) Co_3O_4@2 (b) Co_3O_4@6 (c) CV for both synthesized thin films at 10mV/s scan rate.

4.3 Galvanostatic charge–discharge (GCD) measurement :

The GCD curves of for Co_3O_4@2 (in figure 3a) and Co_3O_4@6 (in figure 3b) were studied within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) at 5, 7.5, 10, & 15 mA cm^{-2} current densities, using a three-electrode cell in 2 M KOH aqueous electrolyte. Variation in capacity as a function of current density displayed the high areal capacitance at low current density . Discharge curve of Co_3O_4@2 and Co_3O_4@6 shows a significant deviation from a straight line, indicating that the capacity mainly comes from the faradaic redox reactions.

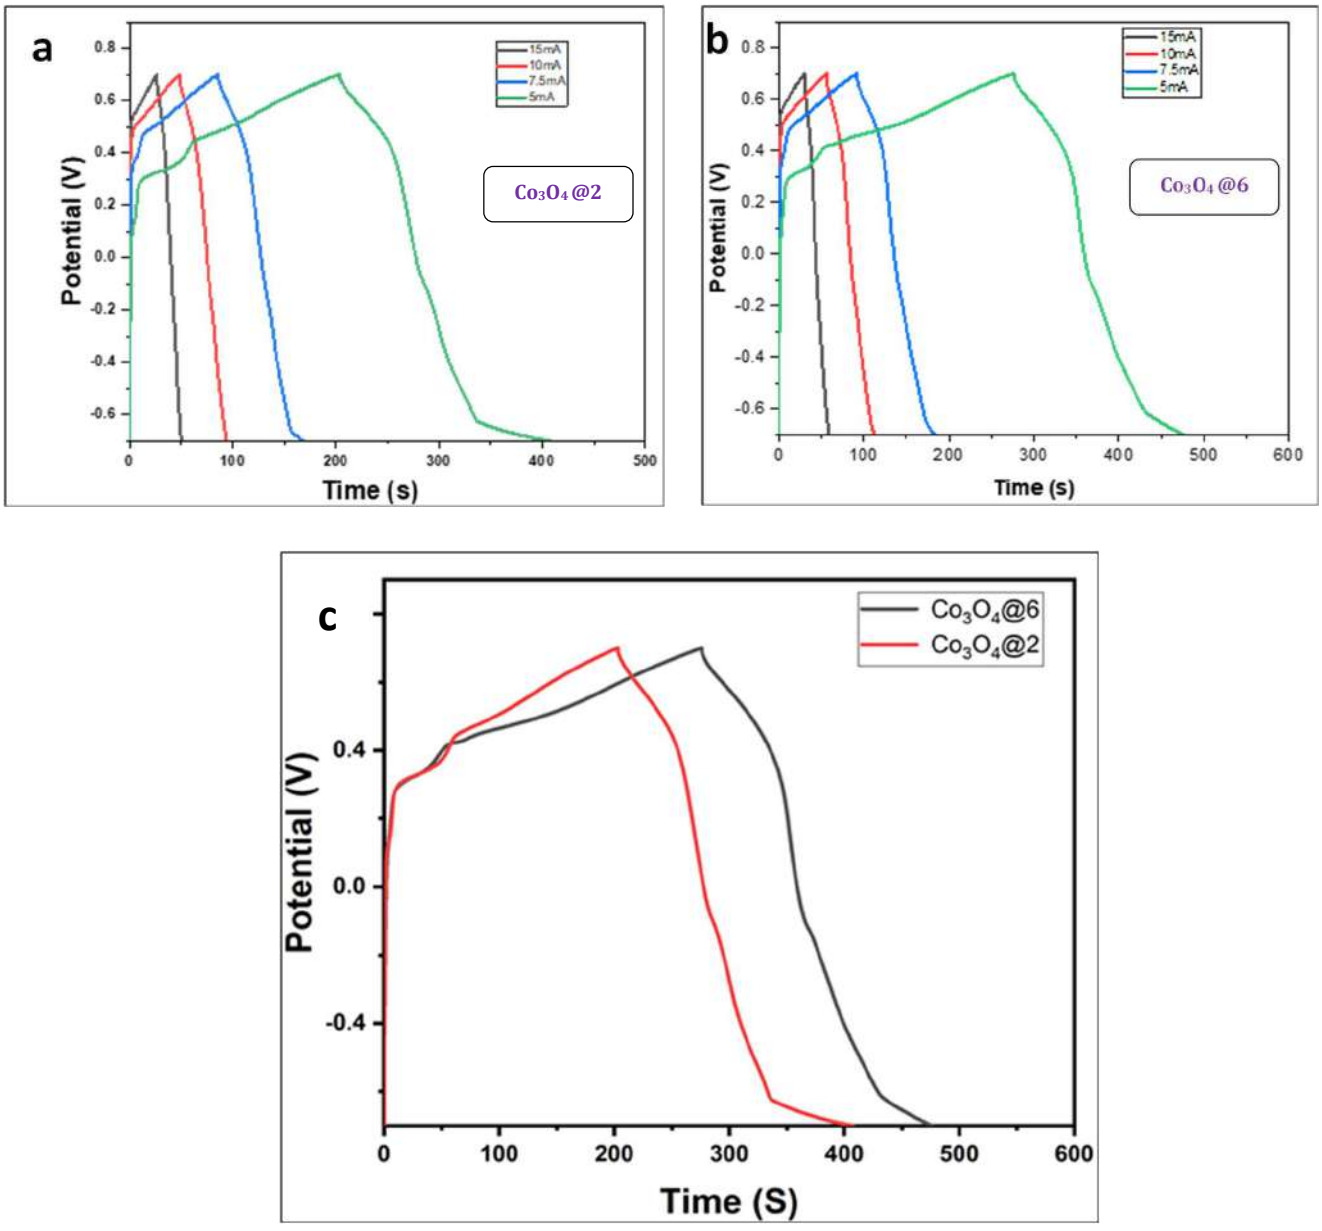

Figure 3. GCD curve recorded at within a potential range of 0.7 V to -0.7 V (vs Ag/AgCl) are performed at 5, 7.5, 10, & 15 mA cm^{-2} current densities using a three-electrode cell in 2 M KOH aqueous electrolyte of as-synthesized (a) Co_3O_4@2 (b) Co_3O_4@6 (c) GCD for both synthesized thin films at 5 mA cm^{-2} current density.

4.4 ELECTROCHEMICAL IMPEDANCE MEASUREMENTS (EIS) :

EIS was studied for Co_3O_4 nanoflower electrode in the frequency range of 100000 Hz to 0.1 Hz at 10 mV applied potential with respect to reference electrode is shown in Figure 4. The diameter of the semicircle in EIS spectrum represent the electron transfer resistance (R_{ct}), which controls the electron transfer kinetics of the redox reaction at the electrode interface. Thus, both the Co_3O_4@6 and Co_3O_4@2 exhibited high electrochemical performance with low R_{ct}. The curve of Co_3O_4@2 showed a smaller diameter of the semicircle than that of the Co_3O_4@6. Low internal resistance is achieved by decreasing the time of hydrothermal process, that facilitates the electron transfer kinetics and resulted in improved areal capacity.

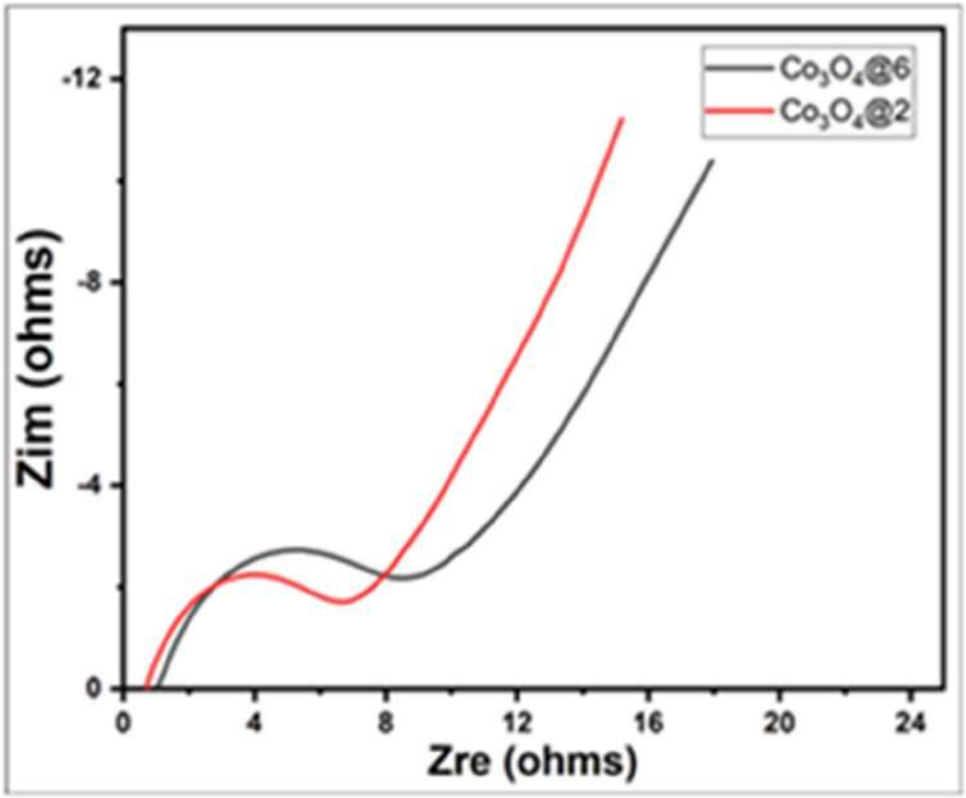

Figure 4. EIS of as synthesized Co_3O_4@2 and Co_3O_4@6 nanostructures.

Conclusions:

Nanostructured Co_3O_4 thin film has been deposited by hydrothermal method for high performance energy storage application. The effect of varying hydrothermal temperature and time on the morphology and capacitance of as-synthesized electrode was investigated. SEM study revealed non-uniform nanoflowers having sharp spikes microstructures was resulted. As the reaction time in second hydrothermal decreses, the density of spikes increases and nanoflowers spikes becomes more sharp. The obtained electrode delivered high operating voltage (about 1.4V), low resistance with a areal capacitance of 362 mF cm^{-2} at a 10 mV s^{-1} scan rate. The effect of reaction time variation in synthesis process on electrochemical performance is studied and decrease of hydrothermal time resulted in low resistance and relatively high areal capacitance of synthesized electrode. The excellent capacitance of the nanostructured Co_3O_4 is due to large surface area provided by nanostructured Co_3O_4 with porous morphology having sharp spikes. It has been evidenced that the morphology resulted in good areal capacitance which confirms that the film deposited by double hydrothermal route are well suited for high performance energy storage application.

Students Seminar

23th Feb to 24h Feb 2022

REPORT

With the aim to encourage students to explore the concepts and to improve presentation skill and to improve confidence and better communication skill in students, Department of Botany organized Seminars for B. Sc. I students on 23th and 24th February 2022. For seminars students were selected topics of their interest specifically from the syllabus. Every student was given 10 minutes for presentation and 5 minutes for discussion. Dr. M. S. Bansode and Dr. S. H. Jadhav were the in charge for the seminar.

39 students delivered seminars. Seminars improved the confidence in participated students and help students to improve their subject knowledge.

— Unit-3 : Synthetic Polymers —

- **Introduction :-**

Polymers means -(Poly - many, mer - part)

A polymer is defined as complex & giant molecule of very high molecular weight formed by liking together a large number of similar or dissimilar monomers.

- Polymer is synthesized by chemical reaction called polymerization.

The shorthand notation used by chemists to represent polymerization reaction is as under.

$$n\,CH_2 = CH_2 \xrightarrow{\text{Polymerization}} -(CH_2-CH_2)_n-$$

monomer — polymer

Monomer is reactant at the left & the polymer is product at the right hand side.

- Classification of polymers :

Polymers can be classified on the basis of their origin, chemical structure, physical properties, mechanical behaviour, thermal characters etc.

i) Based on origin
ii) Based on composition
iii) Based on method of preparation
iv) Based on general physical properties.
v) Based on structure.

i) Based on origin :

Based on the source they can be of three types.

(a) Natural polymer :- are obtained from natural plants & animals sources. e.g cotton rubber (plant), silk, wool, leather (animals) etc. they have more complex structures compared to synthesis polymers.

(b) Synthetic polymers : are obtained by polymerizing low molecular weight monomers. e.g. Polyethylene PVC, nylon, teryline etc.

(c) Derived polymers are chemically modified forms of natural polymers. e.g. cellophene, cellulose, rayon, leather etc.

ii) Based on composition :

They are two types -

i) Organic polymers are made of carbon, backbone chain.

e.g. Most synthetic & natural polymers belong to this class. e.g: cotton, rubber silk, wool, leather etc.

ii) Inorganic polymers lack carbon backbone. e.g. Glass, silicon etc.

Homopolymer - it is a polymer synthesized using only one type of monomers.

Heteropolymer - it is polymer synthesized using more then one type of monomers.

e.g. Nylon-66, proteins, nucleic acid etc.

iii) Based on method of preparation -

(a) Addition polymers :-

They are the polymers formed by addition polymerization of olefinic (alkene) monomers.

e.g. polyethylene, polypropylene, polyvinyl chloride etc.

(b) Condensation polymers :-

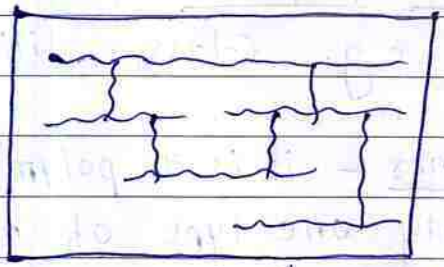

They are the polymers formed by condensation polymerization. Here two reactive functional groups (eg. -COOH, $-NH_2$, -OH etc).

iv) Based on general physical properties :-

(a) Elastomers :-

Elastomer is a polymer having high degree of elasicity.

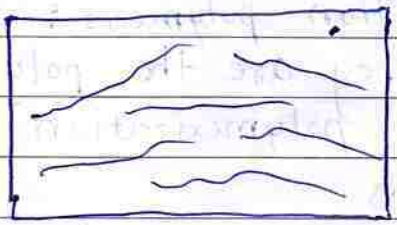

Natural rubber is an elastomer.

— Elastomer in stretched state —

(b) Thermoplastics :-

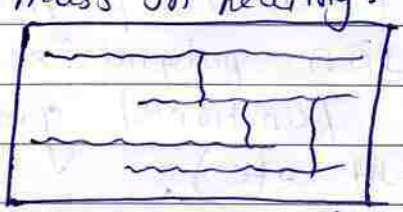

They are the polymers which soften on heating & stiffen on cooling.

— Thermoplastic —

(c) Thermosettings :-

Polymers which change to an infusible & insoluble mass on heating.

— Thermo setting (showing cross-links) —

• The Solid State • (Physical chemistry).

- Introduction -

1. Matter mainly exists in three different states, solid, liquid, gases. Plasma state is also considered as forth state of matter.
2. Gases have neither definite shape or nor definite volume. The gaseous molecules have very less interaction between them and free to move in any direction.
3. Liquids have definite volume but indefinite shape. The molecules have moderate interaction between them.
4. Solids have both definite shape & volume. Solids are rigid and the volume of solid changes very slightly with temp. and pressure.
5. The forces of attraction between solid molecules is very high.

There are two type of Solid state:

1. Amorphous solids - • Amorphous solids have no definite geometrical shape because there is no regular arrangement of atoms, ions or molecules.
   - The regularity of internal structure is partial. These are really intermediates between solids and liquids. So they are also called as super cooled liquids with very high viscocity.
   - These have no sharp melting point.
   - Amorphous solids are isotropic i.e their physical properties like mechanical, thermal, electrical properties are same in all directions.
   - e.g - Glass, rubber, Plastic etc.

2. Crystalline solids - • Crystalline solids have definite internal arrangement of atoms, ions or molecules. So they have definite geometrical shape. These are called as true solids.
   - They have sharp melting points.
   - crystalline substances is ~~Ans~~ Anisotropic. i.e its physical properties

such as mechanical, thermal, electrical properties are different in different directions.
e.g - NaCl, KCl, ZnS, $CuSO_4$ etc.

- Space lattice, Lattice sites, Lattice planes, Unit cell -

i) Space lattice -

- Lattice means the systematic and symmetrical arrangement of points or particles in space.
- In a crystal, the atoms, ions or molecules are not oriented at random but are packed together with greater order and regularity in three dimensional pattern.
- Space lattice may be defined as an array of points showing how atoms ions or molecules are arranged at different sites in three dimensional space.
- i.e. space lattice is a three dimensional arrangement of identical points in a space. An imp. characterstic of a space lattice is that each point representing an atom or ion has the same surrounding as any other point representing the same atom or ion.

ii) Lattice sites -

- The positions occupied by a point or particles in crystal lattice is called as lattice site or lattice point.
- The crystals are bound by external faces which are generally planner these are called as faces of the crystal.
- The angles between two intersecting faces is called is interfacial angle.

iii) Lattice planes -

- The points in a space lattice can be arranged in a Number of parallel & equidistant planes which are called as lattice planes.
- The external faces of the crystal are parallel to these planes.

Nanotechnology

Application of Nanotechnology :

1) Electronics : Nowdays nanocrystalline material to used in electronic applicances so that its size is decreased & efficiency is increased. The flat panel displays of television & computer monitors are the result of nanomaterial.

2) Energy : Fuel cells - Nanotechnology is used to reduce the cost of catalysis used in fuel cells to produce hydrogen ions from Fuel cells as methenol.

3) Industry : Cutting tools made by nanocrystalline material such as tungsten, carbide, tantalum carbide & titanium carbide much harder much more wear - resistant erosion resistant & last more larger Nanometerial used in microdrills.

4) Food - Agriculture : Nanomaterials in now widely used in food packaging, Food processing, catalysis also in Food quality / safely analysis sensor.

5) Health care : Nanocrystaline material is used in drug controlled relase in cancer therapy.

6) Textile : Nanomaterial is used in textile, industry to produce specicallised elothus, with wider application this is used in medical textile, Technical textile, self cleaning textile.

7) Environment : Nanomaterials are used as catalyst in many reactions due to which evolution of hazardous gases and chemical is decreased. These are use in pollution scavenger, pollution monitoring senser.

8) Cosmatices : Nowdays various types of creams & gels consist of nanomaterial such as zinc oxide & titanium oxide.

9) Domastic applications : Is used in various domestic applications such as air purifiers, air conditioners, water purifiers, refrigerators window material etc.

10) High sensitive sensors : various types of sensors are used in diverse field. Nanomaterial zicronium oxide used in carbon monoxide sensors. Nanomaterials is used in smoke detector, ice detectors, on air craft lasting sateli-tes, self cleaning glases of motor car etc.

* Synthetic Polymers *

1] Introduction:-

Polymer: Poly - many
mer - parts
polyethene
co-polymer
denoted by 'n'

eg. $n.CH_2 = CH_2 \xrightarrow{\text{Polymerisation}} -(CH_2-CH_2)_n-$

ethene (monomer)

Polyethene

Polymer is synthesized by chemical reac^n called as polymerisation.

living without is an polymer is anthickable. infact our body itself is built by varity at polymer like DNA, RNA, protein, carbohydrates, etc.

Food, cloth, paper, pen, brush, many untensils, gum, mate carry bag etc.

We routinly are all polymers we living in polymer world.

2] Classification of polymers:

① Based on origin:

Three types.

(i) Natural polymer
(ii) Synthetic polymer
(iii) Derived polymer.

(i) Natural polymer: Natural polymer obtained from nature, plants & animals, etc. eg. cotton, rubber, silk, pull, leather.

They have more complex structure compare to synthetic poly.

(ii) Synthetic polymer:

Synthetic poly. obtained by polymerising low

molecular weight of monomers eg. polyethylene, PVC, nylon, terylene, etc.

(iii) Derived polymer:

Derived poly. obtained from chemically modified forms of natural polymers eg. cellulose, Rayon, etc.

(2) Based on composition:- Mainly 2 types

(i) Organic polymers: eg. most synthetic cotton, silk organic poly. are made of carbon backbones chain.

(ii) Inorganic polymer:

Inorganic poly. means lack carbon backbones eg. Silicon, glass, etc.

① Homo polymer: It is poly. synthesized using only one type of monomers eg. Nylon 6, polyethene, etc.

② Hetro polymer: It is synthesized by using more than one type of monomers eg. Nylon 66, proteins etc.

(3) Based on method of preperation:-

Polymerisan rean used for poly. synthesis methods of preparn can be classified mainly 2 types.

(i) Addition polymer:

Formed by addition polymerisation of olefinic [alkene] monomer.

The polymerisn rean are catalised by per oxide, acids & zigler catalyst eg. polyethylene & polyproper

(ii) Condensation polymer:

Condensation polymer formed by condensn polymeris here 2 reactive, functional group -COOH -NH_2 -OH

monomers condense with the elimination of some small molecule like H_2O, NH_3, CH_3OH
e.g. cellulose protein, nylon 66 & terylin, etc.

(4) General physical properties:
① Elastomers: It is general term used to discribe rubber or rubber like polymer. Elastomer polymer having high degree of elastocity. [Elastomer stread to form 3 times of its original length by appling streching forces] [amorphese form in unstreched condition. The polymer chain are randomly oriented so called as amorphese form].
② Thermoplastic:-
Thermoplastic polymer which sooften on heating & stifen on cooling.
The process of heating reshaping & reteing. The shape on a cooling can be repeated several times without decomposition or change in chemical composition of the polymer.
③ Thermosetting: Thermosetting which change to an infusible & insoluble mass on heating.
A thermosetting material become permanently hard when heated above the critical temp. & reheating will not sooften it again.
The chemical change [usually cross linking] on heating & convert into insoluble mass is a irreversible. so they can be heat treated & molded only ones.

(5) Based on structure: A polymer said to be linear if it has only 2 end residue per molecule but m-

any times they can be branched or joined together in a cross linking. more extensive cross linking lead to the polymerization formation 3 dimensional cross linking polymer also called as network polymer.

Introduction – Human desire for long and healthy living has kept him searching remides for sufferings. The foundation of modern medicine was laid by Greak physician Hippocrates. He the first time introduced the Concept of disease as pathalogical process paracelous postulates life is essentially Chemical process he used simple chemical like mercury, sulphur, iron, Copper etc. but systematic progress in use of drugs.

Classification of drugs –

Any chemical substance that affects the functioning of living things and the organisms [such as bacteria, Fungi and viruses] that infect them is called drugs.

Drugs are Classified on the basis of mode of action, structure, but non of these are Completely satisfactory.

1) Functional drugs
2) Chemotheropeutic agents

1) Functional drugs –

These drugs modulates various physiological function like blood Circulation, blood Filtration and Growth etc.

The symtom of discom – fort Caused by Change in the physiological activities depending upon function affected they are sub grouped into following types –

1) CNS drugs – Central Nervous system
2) Analgesis

3) Antipyretics – Lower body temperature in Condition Fever do not decreases it below normal body temp.

4) Antidiabeties – They are drug used to Control pathological Condition Called diabeties.
Body sugar level in the human body is less than 140 mg/dl is normal level.

5) Cardiac drugs – They drug direct action on heart.

2) Chemotherapeutic agents –
The Chemotherapeutic agent are drugs used in the treatment of infection disease.
The pathogens are disease Causing parasitic micro-organisms eg – bacteria, Fungi
these agent are sub Classified into Following type

1) Antiviral agent – The drugs affect against viral pathogen
Eg – Antibiotics

2) Antineoplastic agent – used to treat Cancer.
Eg – Malphalan

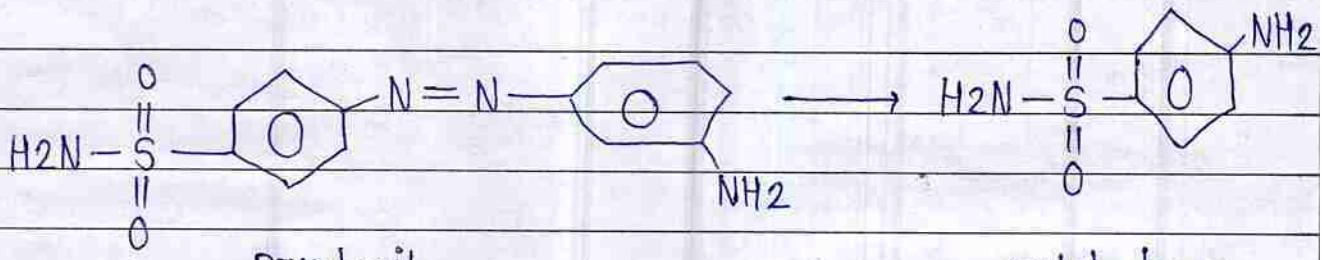

3) Antiseptic – directly applied to skin Called antiseptic agents.
Eg – Phenol, detol

4) Antifungal agent – used against Fungal infection.

5) Antimaterials – malaria symtoms – Fever
– Vomitting
– headaches
– skin yellow
